Advanced scRNA-seq Cheatsheet

The tables below consist of valuable functions or commands that will help you through this module.

Each table represents a different library/tool and its corresponding commands.

You may also be interested in the following additional cheatsheets:

- Download the PDF for the Introduction to R and Tidyverse cheatsheet
- Download the PDF for the Introduction to Single-Cell RNA sequencing cheatsheet

Please note that these tables are not intended to tell you all the information you need to know about each command.

The hyperlinks found in each piece of code will take you to the documentation for further information on the usage of each command.

Please be aware that the documentation will generally provide information about the given function's most current version (or a recent version, depending on how often the documentation site is updated).

This will usually (but not always!) match what you have installed on your machine.

If you have a different version of R or other R packages, the documentation may differ from what you have installed.

Table of Contents

- scater
- miQC
- batchelor and harmony
- pheatmap and EnhancedVolcano
- DESeq2 and pseudo-bulking functions
- tidyverse functions
 - purrr functions
 - ggplot2 functions
 - dplyr, tidyr, stringr, and tibble functions
- Seurat and SCE object conversion
 - Converting from Seurat to SCE
 - Converting from SCE to Seurat
 - Approaches from ScPCA

scater

Read the scater package documentation, and a vignette on its usage.

Library/Package	Piece of Code	What it's called	What it does
scater	<pre>plotReducedDim()</pre>	Plot reduced dimensions	Plot a given reduced dimension slot from a SingleCellExperiment object by its name
scater	plotUMAP()	Plot UMAP	Plot the "UMAP"-named reduced dimension slot from a SingleCellExperiment object
scater	plotExpression()	Plot expression	Plot expression values for all cells in a SingleCellExperiment object, using the logcounts assay by default

miQC

Read the miQC package documentation, and a vignette on its usage.

Library/Package	Piece of Code	What it's called	What it does
miQC	mixtureModel()	Mixture model	Fit a miQC mixture model to a SingleCellExperiment object for use in filtering
miQC	filterCells()	Filter cells	Filter cells from a SingleCellExperiment object based on a miQC model, returning a filtered SingleCellExperiment object
miQC	plotMetrics()	Plot metrics	Plot percent of mitochondrial reads against the number of unique genes found for each cell
miQC	plotModel()	Plot model	miQC::plotMetics() with the miQC fitted model overlaid
miQC	plotFiltering()	Plot filtering	Plot percent of mitochondrial reads against the number of unique genes found, coloring points based on whether they will be filtered out or not

batchelor and harmony

Read the batchelor package documentation, and a vignette on its usage.

Read the harmony package documentation, and a vignette on its usage.

Library/Package	Piece of Code	What it's called	What it does
batchelor	MultiBatchPCA()	Multi-batch PCA	Perform PCA across multiple gene expression matrices, weighted by batch size
batchelor	fastMNN()	Fast mutual nearest neighbors correction	Perform integration on an SCE object with mutual nearest neighbors using the fastMNN algorithm, returning an SCE object with batch-corrected principal components
harmony	HarmonyMatrix()	Perform harmony integration on a matrix	Perform integration with harmony on either a matrix of principle components or gene expression, returning a matrix of batch-corrected principal components

pheatmap and EnhancedVolcano

Read the pheatmap package documentation.

Read the EnhancedVolcano package documentation, and vignette on its usage.

Library/Package	Piece of Code	What it's called	What it does
pheatmap	pheatmap()	Pretty heatmap	Plot a (pretty!) clustered heatmap
EnhancedVolcano	EnhancedVolcano()	Enhanced volcano	Plot a volcano plot to visualize differential expression analysis results

DESeq2 and pseudo-bulking functions

Read the DESeq2 package documentation, and a vignette on its usage.

Library/Package	Piece of Code	What it's called	What it does
scuttle	aggregateAcrossCells()	Aggregate data across groups of cells	Sum counts for each combination of features across groups of cells, commonly used to pseudo-bulk SCE counts
DESeq2	DESeqDataSet()	DESeq Dataset	Establish a DESeq object from a pseudo- bulked SingleCellExperiment object or a bulk SummarizedExperiment object
DESeq2	estimateSizeFactors()	Estimate size factors	Estimate size factors which are used to normalize counts for differential expression analysis

Library/Package	Piece of Code	What it's called	What it does
DESeq2	rlog()	Apply a regularized log transformation	Log2-transform counts in a DESeq object for differential expression analysis
DESeq2	plotPCA()	Sample PCA plot for transformed data	Plot sample PCA from a log-transformed DESeq object to check for batch effects
DESeq2	DESeq()	Perform differential expression analysis	Perform differential expression: Estimate size factors, transform data, estimate dispersions, and perform testing.
DESeq2	plotDispEsts()	Plot dispersion estimates	Plot dispersion estimates from a fitted DESeq object to evaluate model fit
DESeq2	results()	Extract results from a DESeq analysis	Extract results from a fitted DESeq object into a data frame
DESeq2	resultsNames()	Extract results names	Return coefficient names from a fitted DESeq object
DESeq2	lfcShrink()	Shrink log2 fold changes	Add shrunken log2-fold changes to a results table produced by DESeq2::results()

tidyverse functions

purrr functions

Read the purr package documentation and a vignette on its usage, and download the purr package cheatsheet.

Library/Package	Piece of Code	What it's called	What it does
purrr	map()	map	Apply a function across each element of list; return a list
purrr	imap()	imap	Apply a function across each element of list and its index/names; return a list
purrr	map2()	map2	Apply a function across each element of two lists at a time; return a list
purrr	reduce()	Reduce	Reduce a list to a single value by applying a given function

Note that purrr::map() functions can take advantage of R's new (as of version 4.1.0) anonymous function syntax:

```
# Multi-line syntax:
\(x) {
    # function code goes  #
    # inside the curly braces #
}

# Example: Use an anonymous function with `purrr::map()`
# to get the colData's rownames for each SCE in `list_of_sce_objects`
purrr::map(
    list_of_sce_objects,
    \(x)\) rownames(colData(x))
}
```

ggplot2 functions

Read the ggplot2 package documentation and an overall reference for ggplot2 functions, and download the ggplot2 package cheatsheet.

Library/Package	Piece of Code	What it's called	What it does
ggplot2	<pre>geom_bar()</pre>	Barplot	Creates a barplot of counts for a given categorical variable when added as a layer to a ggplot() object
ggplot2	<pre>scale_fill_brewer()</pre>	Add brewer fill scale	Apply a Brewer "fill" color palette to a categorical variable in a ggplot() object
ggplot2	guides()	Guides	Function to customize legend ("guide") appearance
ggplot2	<pre>facet_grid()</pre>	Facet grid	Plot individual panels using specified variables to subset the data across rows and/or columns of a grid
ggplot2	vars()	Vars	Helper function to specify variables to facet_grid() or facet_wrap()
ggplot2	theme_bw()	Black and white theme	Display ggplot with gridlines but a white background
ggplot2	theme()	Theme	Customize elements of a ggplot plot theme
ggplot2	element_text()	Element text	Customize textual elements of a ggplot theme

dplyr, tidyr, stringr, and tibble functions

Read the full documentation and download cheatsheets (where available) for these tidyverse packages at the following links:

- dplyr documentation and dplyr cheatsheet
- tidyr documentation and tidyr cheatsheet
- stringr documentation and stringr cheatsheet
- tibble documentation

Library/Package	Piece of Code	What it's called	What it does
dplyr	pull()	Pull	Extract a single column from a data frame into a stand-alone vector
dplyr	count()	Count	Count the number of observations in each group of a data frame
dplyr	left_join()	Left join	Joins two data frames together, retaining only rows present in the first ("left") argument to the function
dplyr	relocate()	Relocate	Change column order in a data frame by relocating one or more columns
dplyr	case_when()	Case when	Return a value based on a set of TRUE / FALSE comparisons; a vectorized if-else
tidyr	pivot_longer()	Pivot longer	Convert a "wide" format data frame to a "long" format data frame
tibble	as_tibble()	As tibble	Convert an object to a tibble
stringr	str_detect()	String detect	Returns TRUE / FALSE if a string contains a given substring
stringr	str_starts()	String starts	Returns TRUE / FALSE if a string starts with a given substring

Seurat and SCE object conversion

When converting between Seurat and SCE objects, it's helpful to know how the different object types store and refer to similar information.

The table below shows different aspects of single-cell objects and how to access the associated data, assuming the default names for each type of single-cell object.

There are several differences between Seurat and SCE objects that are useful to be aware of when converting them. Importantly, the term "assay" refers to different things in SCE vs. Seurat objects:

- In an SCE object, an assay is a matrix of counts, with default names "counts" for raw counts and "logcounts" for normalized counts.
- In a Seurat object, an assay instead refers to an experiment. The default Seurat assay is called "RNA", and it is analogous to the "main experiment" in an SCE object, which is not given a particular name.
- The Seurat count matrices are stored within a given assay (experiment) and have default names of "counts" for raw counts and "data" for normalized counts.

In addition, by default, SCE reduced dimension names are capitalized (e.g., "PCA"), and Seurat reduced dimension names are in lower case (e.g., "pca").

Always bear in mind that your object(s) may be named differently from the defaults as described here!

Data aspect	SCE	Seurat
Raw counts matrix	counts(sce_object)	seurat_obj[["RNA"]]@counts
Normalized counts matrix	logcounts(sce_object)	seurat_obj[["RNA"]]@data
Reduced dimension: PCA matrix	<pre>reducedDim(sce_object, "PCA)</pre>	seurat_obj\$pca@cell.embeddings
Reduced dimension: UMAP matrix	reducedDim(sce_object, "UMAP)	seurat_obj\$umap@cell.embeddings
Cell-level metadata	colData(sce_object)	seurat_obj@meta.data
Feature (gene)-level metadata	rowData(sce_object)	seurat_obj[["RNA"]]@meta.features
Miscellaneous additional metadata	metadata(sce_object)	seurat_obj@misc

Below, we provide some code examples below for how you can accomplish these conversions.

For all code examples below, it is assumed that the SingleCellExperiment library has been loaded into your R environment:

library(SingleCellExperiment)

Converting from Seurat to SCE

The following example code assumes you have a Seurat object called seurat_obj.

```
# Convert Seurat object to SCE object
sce_object <- Seurat::as.SingleCellExperiment(seurat_obj)</pre>
```

By default, all assays (experiments) present in the Seurat object will be ported into the new SCE object.

Recall, in Seurat, an assay refers to an experiment which may be associated with multiple count matrices.

To only specify that certain assays are retained, you can optionally provide the argument assay with *Seurat assay names* to retain in the SCE object, for example:

```
# Convert Seurat object to SCE object, retaining only the 'RNA' experiment (assay)
sce_object <- Seurat::as.SingleCellExperiment(seurat_obj, assay = "RNA")</pre>
```

Specifying assay is mostly useful if there are alternative experiments, for example from CITE-Seq data, present in the Seurat object that you do not want to retain during SCE conversion.

Converting from SCE to Seurat

The following example code assumes you are starting with an SCE object called sce_object.

The function Seurat::as.Seurat() can be used to convert an SCE object into a Seurat object and takes the following arguments:

- · The SCE object to convert
- · Optional named arguments with the following defaults:
 - counts = "counts" specifies that the SCE object contains a "counts" assay of normalized counts that should be included during conversion.
 - If there is no "counts" assay in the SCE object, set this argument as counts = NULL or rename accordingly, e.g. counts = "whatever_assay_name_you_are_using".
 - data = "logcounts" specifies that the SCE object contains a "logcounts" assay of normalized counts that should be included during conversion.
 - If there is no "logcounts" assay in the SCE object, set this argument as data = NULL or rename accordingly, e.g.
 data = "whatever_assay_name_you_are_using".
 - assay = NULL specifies that, by default, all assays (experiments) will be converted. If there are multiple assays and you wish to only convert, for example, the "RNA" assay, set this argument as assay = "RNA".
 - project = "SingleCellExperiment" specifies that the Seurat object being created will have this associated project name. You can override this with any string of interest, e.g. project = "sample_XYZ".

```
# Convert SCE object to Seurat object, assuming both
# `counts` and `logcounts` assays are present
seurat_object <- Seurat::as.Seurat(sce_object)

# Convert SCE object to Seurat object, where the SCE object
# contains a `counts` but not a `logcounts` assay
seurat_object <- Seurat::as.Seurat(sce_object, data = NULL)</pre>
```

Approaches from ScPCA

In addition, this documentation from the ScPCA introduces how to convert SCE objects to Seurat objects.

Although this documentation was written for ScPCA datasets, the steps generally apply to any SCE object.

It's worth noting that the example code provided at that link will only retain a single assay (raw "counts") in the new SCE object, and it will not retain reduced dimension representations (e.g., PCA or UMAP).

Therefore, this example code is mostly useful at the early stages of processing before you have performed normalization and calculated reduced dimensions.
